This Service Manual describes the technical features and servicing procedures for the KYMCO Downtown 125i.

Section 1 contains the precautions for all operations stated in this manual. Read them carefully before any operation is started.

Section 2 is the removal/installation procedures for the frame covers which are subject to removal/installation frequency during maintenance and servicing operations.

Section 3 describes the inspection/adjustment procedures, safety rules and service information for each part, starting from periodic maintenance.

Sections 5 to 12 give instructions for disassembly, assembly and adjustment of engine parts. Section 13 is the AFI system. Section 14 to 15 is the removal/installation of chassis. Section 16 to 19 states the testing and measuring methods of electrical equipment.

Most sections start with an assembly or system illustration and troubleshooting for the section. The subsequent pages give detailed procedures for the section.

The information and contents included in this manual may be different from the motorcycle in case specifications are changed.

TROUBLESHOOTING

**Noisy exhaust muffler**
- Damaged exhaust muffler
- Exhaust muffler joint air leaks

**Lack of power**
- Caved exhaust muffler
- Clogged exhaust muffler
- Exhaust muffler air leaks
FASTENER REMOVAL AND REINSTALLATION

REMOVAL
Depress the head of fastener center piece ①.
Pull out the fastener.

INSTALLATION
Let the center piece stick out toward the head so that the pawls ② close.
Insert the fastener into the installation hole.

* To prevent the pawl ② from damage, insert the fastener all the way into the installation hole

Push in the head of center piece until it becomes flush with the fastener outside face.
2. EXHAUST MUFFLER/FRAME COVERS

FRAME COVERS REMOVAL/INSTALLATION

SEAT
Unlock the seat with the ignition key.
Open the seat.
Remove the two nuts and the seat.

Installation is in the reverse order of removal.

LUGGAGE BOX
Unlock the seat with the ignition key.
Open the seat.
Remove the screw and four bolts, then lift luggage box.

Disconnect the luggage box light connector, then remove the luggage box.

Installation is in the reverse order of removal.
2. EXHAUST MUFFLER/FRAME COVERS

CENTER COVER

Remove the luggage box (see page 2-4).

Remove the center cover.

* During removal, do not pull the joint claws forcibly to avoid damage.

Installation is in the reverse order of removal.

REAR SPOILER/REAR SPOILER STAY

Unlock the seat with the ignition key.
Open the seat.

Remove the three bolts.

Remove the bolt covers and bolts, then remove the rear spoiler.
Installation is in the reverse order of removal.

**UPPER/LOWER HANDLEBAR COVER**

Remove the 4 screws, then remove upper handlebar cover.

Remove the 4 screws, then remove the bottom handlebar cover.

Disconnect the throttle cable refer to the “THROTTLE BODY /TPS” section, then pull the throttle cable out from the lower cover. Remove the lower cover.

Installation is in the reverse order of removal.
2. EXHAUST MUFFLER/FRAME COVERS

WINDSHIELD/WINDSHIELD GARNISH

Remove the 5 bolts and windshield garnish.

Installation is in the reverse order of removal.
2. EXHAUST MUFFLER/FRAME COVERS

FRONT METER VISOR
Remove the windshield (see page 2-6)
Remove the front cover.
Remove 4 screws, then remove the front meter visor.

Installation is in the reverse order of removal.

FRONT COVER
Remove the small front cover (black) screw
Remove the small front cover (black)
Remove the two nuts.

Remove the 8 screws from the inner cover.
Remove the front cover
2. EXHAUST MUFFLER/FRAME COVERS

Disconnect the headlight/position light connect and right/left turn signal light connectors.

Installation is in the reverse order of removal.

FRONT FENDER

Remove the 4 screws and front fender.

Installation is in the reverse order of removal.

RIGHT/LEFT FOOT SKIRT

Kick the button and make the passenger footpeg out.

Remove the 6 screws and right or left foot skirt.

* During removal, do not pull the joint claws forcibly to avoid damage.

Installation is in the reverse order of removal.
2. EXHAUST MUFFLER/FRAME COVERS

FRONT LOWER COVER

Remove the front cover (see page 2-8).
Remove the foot skirt (see page 2-9).

Remove the 7 screws and front lower cover.

Installation is in the reverse order of removal.

REAR FENDER

Remove the body cover then remove the rear fender.

Installation is in the reverse order of removal.

BODY COVER

Remove the center cover (see page 2-5).
Remove the right and left foot skirts (see page 2-9).

Remove the rear spoiler and rear spoiler stay (see page 2-5).

Remove the 6 screws and 2 nuts then remove the body cover.
2. EXHAUST MUFFLER/FRAME COVERS

Disconnect the rear combination light connector.

Installation is in the reverse order of removal.

REAR COMBINATION LIGHT UNDER COVER

Remove body cover (see page 2-10).

Remove the 4 bolts and rear combination light under cover.

Installation is in the reverse order of removal.

FLOORBOARD

Remove the body cover (see page 2-10).
Remove the front lower cover (see page 2-10).

Remove the 1 screws. (Right)
Remove the 8 bolts, then remove the floorboard.

**UNDER COVER**

Remove the four bolts and side stand stop rubber.

Remove the under cover.
remove the fuel tank cap cover.

Installation is in the reverse order of removal.

METER PANEL

Disconnect the speedometer cable.
Disconnect the DC power connectors.

Remove the 1 screws
Remove the ignition key garnish
Remove the 3 screws from the inner cover, then remove the handler panel.

Installation is in the reverse order of removal.
INNER COVER

Remove the front cover (see page 2-8).
Remove the front lower cover (see page 2-10).
Remove the floorboard (see page 2-11).

Remove the 4 bolts and front glove box 1 screw.

Remove the 2 PO bolts then remove
The fuel tank fill cap.
Remove the inner cover
2. EXHAUST MUFFLER/FRAME COVERS

EXHAUST MUFFLER

REMOVAL

Disconnect the O2 heater/O2 sensor connector.

Remove the two exhaust pipe joint nuts

Remove three muffler mount bolts and muffler and gasket.
2. EXHAUST MUFFLER/FRAME COVERS

INSTALLATION

Replace the gasket with new ones.
Install the exhaust muffler and three mounting bolt but do not tighten them.

Install and tighten the two exhaust pipe joint nuts to the specified torque

**Torque:** 20 N•m (2 kgf•m)

Tighten the three mounting bolts

**Torque:** 35 N•m (3.5 kgf•m)

Remove the coolant tank cover.

Installation is in the reverse order of removal

SERVICE INFORMATION

GENERAL

⚠️ WARNING

• Before running the engine, make sure that the working area is well-ventilated. Never run the engine in a closed area. The exhaust contains poisonous carbon monoxide gas which may cause death to people.
• Gasoline is extremely flammable and is explosive under some conditions. The working area must be well-ventilated and do not smoke or allow flames or sparks near the working area or fuel storage area.

MAINTENANCE SCHEDULE

Perform the pre-ride inspection at each scheduled maintenance period. This interval should be judged by odometer reading or months, whichever comes first.

I: INSPECT AND CLEAN, ADJUST, LUBRICATE OR REPLACE IF NECESSARY
C: CLEAN       R: REPLACE       A: ADJUST       L: LUBRICATE

The following maintenance schedule specifies all maintenance required to keep your scooter in peak operating condition. Maintenance work should be performed in accordance with standards and specifications of KYMCO by properly trained and equipped technicians. Your KYMCO dealer meets all of these requirements.

* Should be serviced by your KYMCO dealer, unless the owner has the proper tools and service data and is mechanically qualified.
* In the interest of safety, we recommend these items be serviced only by your KYMCO dealer. KYMCO recommends that your KYMCO dealer should road test your scooter after each periodic maintenance is carried out.

3. INSPECTION/ADJUSTMENT

**FUEL LINE/FUEL FILTER**

Check the fuel lines and replace any parts which show signs of deterioration, damage or leakage.

**THROTTLE OPERATION**

Check the throttle grip for smooth movement. Measure the throttle grip free play.

**Free Play:** 2 ~ 6 mm

Major adjustment of the throttle grip free play is made with the adjusting nut at the carburetor side. Adjust by loosening the lock nut and turning the adjusting nut.
Minor adjustment is made with the adjusting nut at the throttle grip side. Slide the rubber cover (1) out and adjust by loosening the lock nut (3) and turning the adjusting nut (2).

ENGINE OIL

Engine oil recommendation

Use a premium quality 4-stroke motor oil to ensure longer service life of your scooter. Use only oils which are rated, SJ under the API service classification. The recommended viscosity is SAE 10W-40. If a SAE 10W-40 motor oil is not available, select an alternative according to the right chart.

Engine oil capacity:
At disassembly:
  1.2 L
At change:
  1.0L

Engine oil level check

Check the engine oil level each day before riding the scooter. The level must be maintained between the upper and lower level marks on the oil filler cap/dipstick.

1. Start the engine and let it idle for a few minutes.
2. Stop the engine and put the scooter on its center stand on level ground.
3. After a few minutes, remove the oil filler cap/dipstick, wipe it clean, and reinsert the oil filler cap/dipstick without screwing it in. Remove the oil filler cap/dipstick. The oil level should be between the upper and lower marks on the oil filler cap/dipstick.
4. If required, add the specified oil up to the upper level mark. Do not overfill.
5. Reinstall the oil filler cap/dipstick. Check for oil leaks.

* Let the engine and exhaust system cool before working in those areas.
Engine oil replacement

Engine oil quality is the chief factor affecting engine service life. Change the engine oil as specified in the maintenance schedule. When running in very dusty conditions, oil changes should be performed more frequently than specified in the maintenance schedule.

Please dispose of used engine oil in a manner that is compatible with the environment. We suggest you take it in a sealed container to your local recycling center or service station for reclamation. Do not throw it in the trash or pour it on the ground or down a drain.

Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil.

Change the engine oil with the engine at normal operating temperature and the scooter on its center stand to assure complete and rapid draining.
3. INSPECTION/ADJUSTMENT

1. Remove the oil filler cap/dipstick(1) from the right crankcase cover.
2. Place a container under the left crankcase.
3. Remove the oil drain plug (2) to drain the oil.
4. Reinstall the drain plug and tighten the drain plug to specification.
   **Oil drain plug torque:**
   \[25 \text{ N-m (2.5 kgf-m,)}\]
5. Fill the crankcase with the recommended grade oil and install the oil fill cap.
   **Oil capacity (after draining):**
   \[1.0 \text{ liter}\]
6. Start the engine and let it idle for 2—3 minutes.
7. Stop the engine and check that the oil level is at the upper level mark on the oil filler cap/dipstick with the scooter upright on firm, level ground. Make sure there are no oil leaks.

* Let the engine and exhaust system cool before working in those areas.
3. INSPECTION/ADJUSTMENT

Oil strainer screen clean

Change the engine oil with the engine at normal operating temperature and the scooter on its center stand to assure complete and rapid draining.

* Let the engine and exhaust system cool before working in those areas.

1. Remove the oil filler cap/dipstick (1) from the right crankcase cover.
2. Place a drain pan under the crankcase and remove the oil strainer screen cap (2). The spring (3) and oil strainer screen (4) will come out when the drain plug is removed.
   Let the engine oil drain out.
3. Clean the oil strainer screen.
4. Check that the oil strainer screen, sealing rubber and drain plug O-ring are in good condition.
5. Install the oil strainer screen, spring and oil strainer screen cap.

**Oil strainer screen cap torque:**
15N-m (1.5 kgf-m)

5. Fill the crankcase with the recommended grade oil and install the oil filler cap.

**Oil capacity (after draining):**
1.0 liter

6. Start the engine and let it idle for 2—3 minutes.
7. Stop the engine and check that the oil level is at the upper level mark on the oil filler cap/dipstick with the scooter upright on firm, level ground. Make sure there are no oil leaks.
3. INSPECTION/ADJUSTMENT

Oil filter replacement

Change the engine oil with the engine at normal operating temperature and the scooter on its center stand to assure complete and rapid draining.

* Let the engine and exhaust system cool before working in those areas.

1. Remove the oil filler cap/dipstick (1) from the right crankcase cover.

2. Place a drain pan under the crankcase. Remove three bolts and then remove the oil filter cap (2) and O-ring (3). The spring (4) will come out when the filter cap is removed. Let the engine oil drain out.

3. Remove and discard the oil filter (5).

* Do not remain the rubber seal on the oil filter in the oil filter housing.

4. Check that the O-ring is in good condition.
5. Install the new oil filter.

* Make sure the rubber seal on the oil filter facing the left crankcase.

6. Install the spring, O-ring and cap.

   **Cap bolt torque:**

   12 N-m (1.2 kgf-m)

7. Fill the crankcase with the recommended grade oil and install the oil filler cap.

   **Oil capacity (after draining):**

   1.0 liter

8. Start the engine and let it idle for 2—3 minutes.

9. Stop the engine and check that the oil level is at the upper level mark on the oil filler cap/dipstick with the scooter upright on firm, level ground. Make sure there are no oil leaks.
3. INSPECTION/ADJUSTMENT

TRANSMISSION OIL

Oil change

1. Place the scooter in its center stand.
2. Place a drain pan under the drain bolt (1).
3. Remove the transmission oil drain bolt.
4. Remove the transmission oil filler bolt (2), slowly turn the rear wheel and drain the oil.
   After draining the oil completely, install the oil drain bolt with a new sealing washer and tighten it.
   **Torque:** 13 N-m (1.3 kgf-m)
5. Fill the transmission case with recommended oil.
   **Recommended transmission oil:** SAE 90
   **Oil capacity (at draining):** 0.12 liter
6. Install the transmission oil filler bolt with a new sealing washer and tighten it.
   **Torque:** 13 N-m (1.3 kgf-m)
AIR CLEANER

The air cleaner should be serviced at regular intervals. Service more frequently when riding in unusually wet or dusty areas.

Air cleaner element replacement

1. Remove the screws from the air cleaner cover, then remove air cleaner cover.

2. Remove screws from the air cleaner element, then remove and discard this air cleaner element.

4. The new air cleaner element installation is in the reverse order of removal.

Use the KYMCO genuine air cleaner element or an equivalent air cleaner element specified for your model. Using the wrong KYMCO air cleaner element or a non-KYMCO air cleaner element which is not of equivalent quality may cause premature engine wear or performance problems.
SPARK PLUG

Remove the spark plug cap and spark plug.
Check the spark plug for wear and fouling deposits.
Clean any fouling deposits with a spark plug cleaner or a wire brush.

Specified Spark Plug:
DOWNTOWN 125 i: NGK: CR7E

Measure the spark plug gap.
Spark Plug Gap: 0.6–0.7 mm

When installing, first screw in the spark plug by hand and then tighten it with a spark plug wrench.

Torque: 0.9 kgf-m (9 N-m)
3. INSPECTION/ADJUSTMENT

VALVE CLEARANCE

* • Inspect and adjust valve clearance while the engine is cold (below 35°C).

Remove the four bolts, then remove cylinder head cover.

Remove the timing hole cap and O-ring
Remove the crankshaft hole cap and O-ring.

Turn the A.C. generator flywheel clockwise to the top dead center (TDC) on the compression stroke so that the “T” mark on the flywheel aligns with the index mark on the left crankcase cover.

The punch mark on the camshaft should face upward as shown.

If the punch mark on the camshaft are facing downward, turn the crankshaft clockwise one full turn (360°) and the punch mark are facing upward.
3. INSPECTION/ADJUSTMENT

Adjust by loosening the valve adjusting screw lock-nut and turning the adjusting screw until there is a slight drag on the thickness gauge.

Valve Clearance: IN: 0.1 mm
    EX: 0.1 mm

Apply oil to the valve adjusting screw lock-nut threads and seating surface.
Hold the adjusting screw and tighten the lock nut to the specified torque.

Torque: 0.9 kgf-m (9 N-m)

Special tool:
Valve adjuster A120E00036

After tightening the lock-nut, recheck the valve clearance.

Install the removed parts in the reverse order of removal.

IDLE SPEED

* It is not necessary to adjust idle speed for DOWNTOWN125i. The throttle body is factory pre-set, do not loosen or tighten the painted bolts and screws of throttle body. Loosening or tightening them can cause throttle and idle and valve synchronization failure.

Idle Speed:

DOWNTOWN125i: 1650±100 rpm
3. INSPECTION/ADJUSTMENT

CYLINDER COMPRESSION

Warm up the engine before compression test.
Remove the center cover and spark plug cap.
Remove the spark plug.
Insert a compression gauge.
Open the throttle valve fully and push the starter button to test the compression.

Compression:
Downtown125i: 15 kgf/cm²

If the compression is low, check for the following:
• Leaky valves
• Valve clearance to small
• Leaking cylinder head gasket
• Worn pistons
• Worn piston/cylinder

If the compression is high, it indicates that carbon deposits have accumulated on the combustion chamber and the piston head.

DRIVE BELT

Remove the left crankcase cover.
Inspect the drive belt for cracks or excessive wear.
Replace the drive belt with a new one if necessary and in accordance with the Maintenance Schedule.
3. INSPECTION/ADJUSTMENT

CLUTCH SHOE WEAR

Start the engine and check the clutch operation by increasing the engine speed gradually.
If the scooter tends to creep, or the engine stalls, check the clutch shoes for wear and replace if necessary (refer to the “DRIVE PULLEY, DRIVE BELT AND DRIVEN PULLEY” section in the chapter 8).

HEADLIGHT AIM

Remove the front cover
Place the scooter on a level surface
Adjust the headlight beam adjuster.
A clockwise rotation moves the beam up and counterclockwise rotation moves the beam down.
Adjust the headlight beam horizontally by turning the horizontal beam adjuster.
A clockwise rotation moves the beam toward the right side of the rider.
3. INSPECTION/ADJUSTMENT

COOLANT

Inspection

The reserve tank is under footboard left. Check the coolant level through the inspection window (1) at the front lower cover while the engine is at the normal operating temperature with the scooter in an upright position. If the coolant level is below the LOWER level mark (3), remove screw (4) and reserve tank lid (5) and reserve tank cap (6) and add coolant mixture until it reaches the upper level mark (2).
Always add coolant to the reserve tank. Do not attempt to add coolant by removing the radiator cap.
If the reserve tank is empty, or if coolant loss is excessive, check for leaks and see your KYMCO dealer for repair.

Coolant recommendation

The owner must properly maintain the coolant to prevent freezing, overheating, and corrosion, use only high quality ethylene glycol antifreeze containing corrosion protection inhibitors specifically recommended for use in aluminum engines. (See antifreeze container label.) Use only low-mineral drinking water or distilled water as a part of the antifreeze solution. Water that is high in mineral content or salt may be harmful to the aluminum engine.

Using coolant with silicate inhibitors may cause premature wear of water pump seals or blockage of radiator passages.

Using tap water may cause engine damage. The factory provides a 50:50 solution of antifreeze and distilled water in this scooter. This coolant solution is recommended for most operating temperatures and provides good corrosion protection.

A higher concentration of antifreeze decreases the cooling system performance and is recommended only when additional protection against freezing is needed. A concentration of less than 40:60 (40% antifreeze) will not provide proper corrosion protection. During freezing temperatures,
check the cooling system frequently and add higher concentrations of antifreeze (up to a maximum of 60% antifreeze) if required.
3. INSPECTION/ADJUSTMENT

BRAKE FLUID

Brake fluid level:

With the scooter in an upright position, check the front and rear fluid level. It should be above the lower level mark. If the level is at or below the lower level mark "L", check the brake pads for wear. Worn pads should be replaced. If the pads are not worn, have your brake system inspected for leaks.

The recommended brake fluid is DOT 4 brake fluid from a sealed container, or an equivalent.

Other checks:

Make sure there are no fluid leaks. Check for deterioration or cracks in the hoses and fittings.

BRAKE PAD WEAR

Brake pad wear depends upon the severity of usage, the type of riding, and road conditions. (Generally, the pads will wear faster on wet and dirty roads.) Inspect the pads at each regular maintenance interval.

Front brake

Check the cutout in each pad. If either pad is worn to the cutout, replace both pads as a set. See your KYMCO dealer for this service.

Rear brake

Check the cutout in each pad. If either pad is worn to the cutout, replace both pads as a set. See your KYMCO dealer for this service.
3. INSPECTION/ADJUSTMENT

NUTS/BOLTS/FASTENERS

Check all important chassis nuts and bolts for looseness. Tighten them to their specified torque values if any looseness is found.

WHEELS/TIRES

Tire pressure

Insufficient air pressure in the tires not only hastens tire wear but also seriously affects the stability of the scooter. Under inflated tires make smooth cornering difficult and overinflated tires decrease the amount of tire in contact with the ground which can lead to skids and loss of control. Be sure that the tire pressure is within the specified limits at all times. Tire pressure should only be adjusted when the tires are cold.

Cold inflation tire pressure

3. INSPECTION/ADJUSTMENT

STEERING HANDLEBAR

Raise the front wheel off the ground and check that the steering handlebar rotates freely. If the handlebar moves unevenly, binds, or has vertical movement, adjust the steering head bearing.

SUSPENSION

Check the action of the front/rear shock absorbers by compressing them several times. Check the entire shock absorber assembly for oil leaks, looseness or damage. Jack the rear wheel off the ground and move the rear wheel sideways with force to see if the engine hanger bushings are worn. Replace the engine hanger bushings if there is any looseness.

Rear suspension adjustment

Each shock absorber (1) has 5 adjustment positions for different load or riding conditions. Use a pin spanner (2) to adjust the rear shocks. Always adjust the shock absorber position in sequence (1-2-3-4-5 or 5-4-3-2-1). Attempting to adjust directly from 1 to 5 or 5 to 1 may damage the shock absorber. Position 1 is for light loads and smooth road conditions. Positions 3 to 5 increase spring preload for a stiffer rear suspension, and can be used when the scooter is heavily loaded. Be certain to adjust both shock absorbers to the same position.
SIDE STAND

Perform the following maintenance in accordance with the maintenance schedule.

Functional check:

Check the spring for damage or loss of tension and the side stand assembly for freedom of movement.
Check the side stand ignition cut-off system:

1. Place the scooter on its center stand.
2. Put the side stand up and start the engine.
3. Lower the side stand. The engine should stop as you put the side stand down.

If the side stand system does not operate as described, see your KYMCO dealer for service.

GENERAL INSTRUCTIONS

• The maintenance of lubrication system can be performed with the engine installed in the frame.
• Drain the coolant before starting any operations.
• Use care when removing and installing the oil pump not to allow dust and foreign matters to enter the engine and oil line.
• Do not attempt to disassemble the oil pump. The oil pump must be replaced as a set when it reaches its service limit.
• After the oil pump is installed, check each part for oil leaks.

SPECIFICATIONS

| Inner rotor-to-outer rotor clearance | Standard: 0.15 | Service Limit: 0.15
| Outer rotor-to-pump body clearance | 0.15 ~ 0.2     |
| Rotor end-to-pump body clearance    | 0.04 ~ 0.09    |

ENGINE OIL

| Engine Oil Capacity | At disassembly: 1.2 liter | At change: 1.0 liter |
| Recommended Oil     | SAE15W40 API: SJ or SM    |

TROUBLESHOOTING

Oil level too low
• Natural oil consumption
• Oil leaks
• Worn piston rings
• Worn valve guide
• Worn valve guide seal

Poor lubrication pressure
• Oil level too low
• Clogged oil filter or oil passage
• Faulty oil pump

Oil contamination
• Oil not changed often enough
• Faulty cylinder head gasket
• Loose cylinder head bolts
4. LUBRICATION SYSTEM

OIL PUMP

REMOVAL

Remove the flywheel and driven gear (refer to the “STARTER CLUTCH” section in the chapter 10).

Remove the bolt and then oil separator cover.

* When removing and installing the oil pump, use care not to allow dust or dirt to enter the engine.

Pry the snap ring off and remove the oil pump driven gear, then remove the oil pump drive chain.

Remove the two oil separator bolts to remove the oil pump.
INSTALLATION

Install the oil pump and oil separator and tighten the two bolts.

* Make sure the pump shaft rotates freely and arrow on the oil pump is upside.

Install the pump drive chain and driven gear, then set the snap ring securely on the pump shaft.

* Fit the tab of the separator cover into the slit in the separator.
4. LUBRICATION SYSTEM

DISASSEMBLY

Remove the screw and disassemble the oil pump as shown.

INSPECTION

Measure the pump body-to-outer rotor clearance.
4. LUBRICATION SYSTEM

Measure the inner rotor-to-outer rotor clearance.

Measure the rotor end-to-pump body clearance.

ASSEMBLY

Install the outer rotor, inner rotor and pump shaft into the pump body.

* Insert the pump shaft by aligning the flat on the shaft with the flat in the inner rotor. Install the dowel pin.

There is one punch mark on the surface of the inner rotor and outer rotor.
The mark is upside.

SERVICE INFORMATION

GENERAL INSTRUCTIONS

- A floor jack or other adjustable support is required to support and maneuver the engine. Be careful not to damage the scooter body, cables and wires during engine removal.
- Use shop towels to protect the scooter body during engine removal.
- Drain the coolant before removing the engine.
- After the engine is installed, fill the cooling system with coolant and be sure to bleed air from the water jacket. Start the engine to check for coolant leaks.
- Before removing the engine, the rear brake caliper must be removed first. Be careful not to bend or twist the brake fluid tube.

SPECIFICATIONS

Engine oil capacity: at disassembly: 1.2L (1.27 US qt)  
: at change: 1.0 L (1.06 US qt)
Coolant capacity:

- Radiator capacity : 0.87 liter
- Reserve tank capacity : 0.49 liter

TORQUE VALUES

- Engine hanger (Engine side) 5 kgf-m (50 N-m)
- Engine hanger (Frame side) 6.5 kgf-m (65 N-m)
**ENGINE REMOVAL/INSTALLATION**

**REMOVAL**

* Remove the air cleaner
* Disconnect the ECU connector (A)
* Disconnect the O2 heater/O2 sensor connector
* Disconnect the throttle cable (B)

Remove a bolt from fuel hose guide (C).
Disconnect the fuel hose (D) from fuel injector.
Disconnect the WTS connector (E) from WTS.
Disconnect the coolant temperature sensor connector (F) from coolant temperature sensor.
Disconnect the fuel injector connector (G)
Disconnect the output water hose (H)
Disconnect the air bleed hose (I)
Loosen the rear axle nut. 
Support the scooter securely on its main stand. 

Remove the three bolts (1) from rear brake hose clamps. 
Remove the two bolts (2), then remove the rear brake caliper. 

Disconnect the alternator connector (3). 
Disconnect the ignition pulse generator connector (4). 

Release the rubber cap and remove the terminal screw (5) to disconnect the start motor cable from the start motor.
Remove the bolts (6) and engine ground cable.

Remove the spark plug cap (9).
Disconnect the lower radiator hose (10) from lower radiator pipe.

Remove the right and left rear shock absorber lower mount bolts (11).
Remove the engine mount nut (12).
Pull out the engine mount bolt.

Remove the engine from the frame.

* At removing the engine, be careful not to catch your hand or finger between the engine hanger and crankcase.
5. ENGINE REMOVAL/INSTALLATION

INSTALLATION

Installation is in the reverse order of removal.

Tighten the engine mounting bolt/nut to the specified torque.

**Torque:** 5 kgf-m (50 N-m)

Tighten the right and left rear shock absorber lower mount bolts to the specified torque.

**Torque:** 4.0 kgf-m (40 N-m)

Install the rear brake caliper and tighten the mount bolts to the specified torque.

**Torque:** 3.2 kgf-m (32 N-m, 23 lbf-ft)

After installation, inspect and adjust the following:

- Throttle grip free play
- Fill the cooling system with coolant and start the engine to bleed air from the system.

API/ABV Reset
5. ENGINE REMOVAL/INSTALLATION

**ENGINE HANGER**

**REMOVAL**

- Be careful to put the engine down.
- Remove the engine mount nut (1).
- Pull the engine mount bolt (2) out.

Remove the left engine hanger mount bolt (3).
Remove the right engine hanger mount bolt and collar (4).
Remove the engine from frame.

**INSTALLATION**

Installation is in the reverse order of removal.

Tighten the engine hanger mount bolts to the specified torque. (engine side)

**Torque:** 5 kgf-m (50 N-m)

Tighten the engine mount bolt/nut to the specified torque. (frame side)

GENERAL INSTRUCTIONS

- The cylinder head can be serviced with the engine installed in the frame. Coolant in the radiator and water jacket must be drained first.
- When assembling, apply molybdenum disulfide grease or engine oil to the valve guide movable parts and valve arm sliding surfaces for initial lubrication.
- The valve rocker arms are lubricated by engine oil through the cylinder head engine oil passages. Clean and unclog the oil passages before assembling the cylinder head.
- After disassembly, clean the removed parts and dry them with compressed air before inspection.
- After removal, mark and arrange the removed parts in order. When assembling, install them in the reverse order of removal.

SPECIAL TOOLS
Valve spring compressor A120E00040

TROUBLESHOOTING

The poor cylinder head operation can be diagnosed by a compression test or by tracing engine top-end noises.

Poor performance at idle speed
- Compression too low

Compression too low
- Incorrect valve clearance adjustment
- Burned or bend valves
- Incorrect valve timing
- Broken valve spring
- Poor valve and seat contact
- Leaking cylinder head gasket
- Warped or cracked cylinder head
- Poorly installed spark plug

Compression too high
- Excessive carbon build-up in combustion chamber

White smoke from exhaust muffler
- Worn valve stem or valve guide
- Damaged valve stem oil seal

Abnormal noise
- Incorrect valve clearance adjustment
- Sticking valve or broken valve spring
- Damaged or worn camshaft
- Worn cam chain tensioner
- Worn camshaft and rocker arm
6. CYLINDER HEAD/VALVES

CYLINDER HEAD COVER

REMOVAL

Remove the four bolts (2), then remove the cylinder head cover.

INSTALLATION

Install a new cylinder head cover O-ring and install the cylinder head cover.

* Be sure to install the O-ring into the groove properly.

Install and tighten the cylinder head cover bolts to the specified torque in a crisscross pattern.

Torque: 0.8~0.9kgf-m
6. CYLINDER HEAD/VALVES

CAMSHAFT HOLDER

REMOVAL

Turn the A.C. generator fly wheel so that the T mark on the flywheel aligns with the index mark on the crankcase.
Hold the round hole on the camshaft gear facing up and location is the top dead center on the compression stroke.
Remove the two bolts attaching cam chain tensioner and tensioner
Remove the four cap nuts and cylinder 2 bolts washers from camshaft holder and cylinder 2 bolts then remove the cam shaft Bolt.

Remove the camshaft gear and holder Bolt.

INSTALLATION

Install the camshaft gear, Holder bolt and holder washers and nuts.
Tighten the four cylinder head nuts to the specified torque.

Torque:

0.7~1.1 kgf-m (Holder nuts)
1.0~1.4 kgf-m (Cam shaft set plate)
1.8~2.2 kgf-m (Cylinder head M8X1.25)

* Install the camshaft holder with the “EX” mark face exhaust valve side.
* Apply engine oil to the threads of the cylinder head cap nuts.
* Diagonally tighten the cylinder head cap nuts in 2~3 times.
6. CYLINDER HEAD/VALVES

DISASSEMBLY

Take out the valve rocker arm shafts
Remove the valve rocker arms.

INSPECTION

Inspect the camshaft holder, valve rocker arms and rocker arm shafts for wear or damage.

* If the valve rocker arm contact surface is worn, check each cam lobe for wear or damage.

Inspect the rocker arm bore, cam lobe contact surface and adjuster surface for wear/pitting/scratches/blue discoloration.

If any defects are found, replace the rocker arm shaft with a new one, then inspect lubrication system.
6. CYLINDER HEAD/VALVES

Measure the I.D. of each valve rocker arm.

**Service Limits:**
- IN: 10.1 mm
- EX: 10.1 mm

Measure each rocker arm shaft O.D.

**Service Limits:**
- IN: 9.9 mm
- EX: 9.9 mm

Measure arm to shaft clearance. Replace as a set if out of specification.

**Service limits:** 0.1 mm

**ASSEMBLY**

Apply engine oil to the rocker arms and rocker arm shafts.

Install the rocker arms and shafts into the camshaft holder.

- Install the exhaust valve rocker arm shaft on the “EX” side of the camshaft holder and the exhaust rocker arm shaft is shorter.
- Clean the intake valve rocker arm shaft off any grease before installation.
- Align the cutout on the exhaust valve rocker arm shaft with the bolt of the camshaft holder.
6. CYLINDER HEAD/VALVES

CAMSHAFT

REMOVAL

Turn the A.C. generator flywheel so that the “T” mark on the flywheel aligns with the index mark on the crankcase. Hold the round hole on the camshaft gear facing up and the location is the top dead center on the compression stroke.

Remove the tensioner sealing bolt and spring. Remove the two bolts from cam chain tensioner and then remove the tensioner and gasket.

Remove the camshaft holder (refer to the “CAMSHAFT HOLDER” section in this chapter).

Remove the camshaft gear and holder Bolt.

Remove the camshaft from the cam chain.
6. CYLINDER HEAD/VALVES

INSPECTION

Camshaft

Inspect camshaft lobes for pitting/scratches/blue discoloration.

Measure the cam lobe height.

**Service Limits:**

DT 125:
- IN: 25.57 mm
- EX: 25.41 mm

If any defects are found, replace the camshaft with a new one, then inspect lubrication system.

Check each camshaft bearing for play or damage. Replace the camshaft assembly with a new one if the bearings are noisy or have excessive play.
6. CYLINDER HEAD/VALVES

INSTALLATION

Turn the A.C. generator flywheel so that the “T” mark on the flywheel aligns with the index mark on the crankcase.
Keep the round hole on the camshaft gear facing up and align the punch marks on the camshaft gear with the cylinder head surface (Position the intake and exhaust cam lobes down.) and install the cam chain over the camshaft gear.

Install the rocker arms shafts bolt.

Install the camshaft gear.
6. CYLINDER HEAD/VALVES

DISASSEMBLY

Remove the valve spring cotters, retainers, springs, spring seats, oil seals and valves using a valve spring compressor.

- Be sure to compress the valve springs with a valve spring compressor.
- Mark all disassembled parts to ensure correct reassembly.

Special tool:
Valve Spring Compressor   A120E00040
6. CYLINDER HEAD/VALVES

INSPECTION

Remove carbon deposits from the exhaust port and combustion chamber.

* Be careful not to damage the cylinder head mating surface.

Valve /Valve guide

Inspect each valve for bending, burning, scratches or abnormal stem wear. If any defects are found, replace the valve with a new one.

Check valve movement in the guide.
Measure each valve stem O.D.
Measure each valve guide I.D.
Subtract each valve stem O.D. from the corresponding guide I.D. to obtain the stem-to-guide clearance.

* If the stem-to-guide clearance exceeds the service limits, replace the cylinder head is necessary.

Valve spring

Measure the free length of the inner and outer valve springs.
Cylinder head

Check the spark plug hole and valve areas for cracks.
Check the cylinder head for warpage with a straight edge and feeler gauge.

ASSEMBLY

Install the valve spring seats and oil seal.

* Be sure to install new oil seal.

Lubricate each valve with engine oil and insert the valves into the valve guides. Install the valve springs and retainers. Compress the valve springs using the valve spring compressor, then install the valve cotters.

* When assembling, a valve spring compressor must be used.
  * Install the cotters with the pointed ends facing down from the upper side of the cylinder head.

Special tool:
Valve Spring Compressor   A120E00040

Tap the valve stems gently with a plastic hammer for 2～3 times to firmly seat the cotters.

* Be careful not to damage the valves.

7. CYLINDER/PISTON

TROUBLESHOOTING

- When hard starting or poor performance at low speed occurs, check the crankcase breather for white smoke. If white smoke is found, it means that the piston rings are worn, stuck or broken.

## Compression too low or uneven compression
- Worn or damaged cylinder and piston rings
- Worn, stuck or broken piston rings

## Compression too high
- Excessive carbon build-up in combustion chamber or on piston head

## Excessive smoke from exhaust muffler
- Worn or damaged piston rings
- Worn or damaged cylinder and piston

## Abnormal noisy piston
- Worn cylinder, piston and piston rings
- Worn piston pin hole and piston pin
- Incorrectly installed piston
7. CYLINDER/PISTON

CYLINDER AND PISTON

REMOVAL

Remove the cylinder head (refer to “CYLINDER HEAD” section in the chapter 6).

Remove the water hose from the cylinder.

Remove the cylinder.

Remove the cylinder gasket (4) and dowel pins (3).
Clean any gasket material from the cylinder surface.

Remove the piston pin clip

* Place a clean shop towel in the crankcase to keep the piston pin clip from falling into the crankcase.

Press the piston pin out of the piston and remove the piston.
Spread each piston ring and remove it by lifting up at a point opposite the gap.

* Do not damage the piston ring by spreading the ends too far.

Clean carbon deposits from the piston ring grooves.

**INSPECTION**

**Piston ring**

Inspect the piston rings for movement by rotating the rings. The rings should be able to move in their grooves without catching.

Push the ring until the outer surface of the piston ring is nearly flush with the piston and measure the ring-to-groove clearance.

Insert each piston ring into the bottom of the cylinder squarely.

* Use the piston head to push each piston ring into the cylinder.

Measure the piston ring end gap.
Piston/Piston pin

Measure the piston O.D. at the point (A) from the bottom and 90° to the piston pin hole.

Calculate the cylinder-to-piston clearance.

Measure the piston pin hole. Take the maximum reading to determine the I.D..

Measure the piston pin O.D. at piston and connecting rod sliding areas.

Measure the piston-to-piston pin clearance.
Cylinder

Check the cylinder for warpage with a straight edge and feeler gauge in the directions shown.

Check the cylinder wall for wear or damage. Measure and record the cylinder I.D. at three levels in an X and Y axis. Take the maximum reading to determine the cylinder wear.

Calculate the piston-to-cylinder clearance. Take a maximum reading to determine the clearance.

Calculate the taper and out-of-round at three levels in an X and Y axis. Take the maximum reading to determine them.

Measure the connecting rod small end I.D.

Calculate the connecting rod-to-piston pin clearance.
Inspect the exhaust side and intake side chain guides.
Wear/Damage → Replace.

**INSTALLATION**

**Piston ring**

Carefully install the piston rings into the piston ring grooves with the markings facing up.

* Be careful not to damage the piston and rings.
* Do not confuse the top and second rings.
* To install the oil ring, install the oil ring, then install the side rails.

Stagger the piston ring end gaps 120° degrees apart from each other.
Stagger the side rail end gaps as shown.
Cylinder/Piston

Clean any gasket material from the cylinder mating surfaces of the crankcase and oil passage.

Apply engine oil to the piston pin. Apply engine oil to the connecting rod small end and piston pin hole.

Install the piston with the “IN” mark face intake side and piston pin.

Place a clean shop towel over the crankcase prevent the clip from falling into the crankcase.

Install the new pin clip.

* Make sure that the piston pin clips are seated securely.
  * Do not align the piston pin clip end gap with the piston cut-out

Install the dowel pins and gasket.
Apply engine oil to the cylinder wall, piston and piston ring outer surfaces.

Pass the cam chain through the cylinder and install the cylinder over the piston.

* Be careful not to damage the piston rings and cylinder walls.

Install the cylinder head and camshaft holder has installed (refer to the “CYLINDER HEAD” section in the chapter 6),

Connect the water hose.

• Worn drive belt
• Weak driven face spring
• Worn weight roller
• Faulty driven face

Engine stalls or motorcycle creeps
• Broken clutch weight spring
LEFT CRANKCASE COVER

REMOVAL

Remove the 10 left crankcase cover bolts and then remove the left crankcase cover. Remove the gasket and dowel pins.

INSTALLATION

Install the dowel pins and gasket.

Install the left crankcase cover.

* Do not pull out the kick starter spindle. Press in the kick starter spindle when installing the left crankcase cover.

Install and tighten the 10 bolts diagonally to specified torque.
DRIVE AND DRIVEN PULLEYS/KICK STARTER

DRIVE PULLEY, DRIVE BELT AND DRIVEN PULLEY

REMOVAL

Remove the left crankcase cover (refer to the “LEFT CRANKCASE COVER” section in this chapter).

Use the special tool to hold the drive pulley, then remove the nut and ratchet.

Special tool:
Universal holder A120E00017

Remove the drive pulley face and washer.

Hold the clutch outer with the universal holder and remove the clutch outer nut.

Special tool:
Universal Holder A120E00017

Remove the clutch outer, driven pulley assembly and drive belt together.
Remove the movable drive face assembly.

**Drive belt inspection**

Check the drive belt for cracks, separation or abnormal or excessive wear. Measure the drive belt width.

* Use specified genuine parts for replacement.

**Clutch out inspection**

Inspect the clutch outer for wear or damage. Measure the clutch outer I.D.
INSTALLATION

Apply lubricant to the drive face boss inner surface, then install the movable drive face assembly.

Install the clutch outer onto the driven pulley assembly.
Compress the driven pulley assembly by hand, then install the drive belt into the driven pulley assembly.

* The drive belt should be installed so that the arrows on the drive belt periphery point in the normal turning direction if the drive belt has arrow mark.
* The drive belt contact surface of the driven face should be thoroughly cleaned.

Install the driven pulley assembly/clutch outer and drive belt together.

Use the special tool to hold clutch outer, then tighten the nut to the specified torque.

Weight rollers

Check each roller for wear or damage.
Measure outside diameter.

Movable drive face/Slide pieces/Drive pulley face

Check the movable drive face splines for wear, cracks or damage.

Check the ramp plate for cracks or damage.

Check the movable drive face and drive pulley face cracks or damage.
8. DRIVE AND DRIVEN PULLEYS/ KICK STARTER

DRIVE PULLEY ASSEMBLY

Clean the movable drive face, drive pulley face, weight rollers, slide pieces, ramp plate and drive face boss.

* Remove any excess grease.

Install the weight rollers.

* The direction of all weight rollers is the same. The thin side is towards to clockwise.

Install the slide pieces and ramp plate.
Install the drive face boss.
8. DRIVE AND DRIVEN PULLEYS/KICK STARTER

DRIVEN PULLEY DISASSEMBLY

Hold the clutch/driven pulley assembly with the clutch spring compressor.

* Be sure to use a clutch spring compressor to avoid spring damage.

Special tool:
Clutch Spring Compressor   A120E00034

Set the tool in a vise and remove the clutch drive plate nut.

Remove the clutch.
Remove the spring.
Remove the spring collar on the movable driven face.
Remove the three guide pins/rollers, then remove the movable driven face.
Remove the needle bearing from driven face.
Remove the snap ring, then remove the bearing from driven face.
DRIVEN PULLEY INSPECTION

Check the driven pulley for smooth operation. If any scratches or damage is found then replace as a set.

Check the torque cam grooves for wear or damage.

Check guide pins and rollers for wear or damage. If any scratches or damage is found then replace as a set.

Check the spring for damage. Measure the spring free length.

Check the clutch shoe for heat damage. Measure the clutch shoe thickness.
DRIVEN PULLEY ASSEMBLY

Clean any oil from the drive belt sliding surfaces on the driven face.

Filling 12 g of grease to driven face inner side.

Apply grease to lips of the new dust seals and install into the movable driven face.
Coat new O-rings with grease and install them into the movable driven face grooves.

Install the movable driven face onto the driven face.
Install the guide rollers and guide roller pins. Filling 5 g of grease to each guide groove.

Install the guide pins/rollers.

Install spring collar.
Use the special tool to install spring and clutch, then install and tighten the nut to the specified torque.

Oil seal and bearing installer: A120E00014
Bearing puller: A120E00037

TROUBLESHOOTING

Engine starts but motorcycle won't move
• Damaged transmission
• Seized or burnt transmission

Abnormal noise
• Worn, seized or chipped gears
• Worn bearing

Oil leaks
• Oil level too high
• Worn or damaged oil seal
FINAL REDUCTION

REMOVAL

Drain the transmission gear oil into a clean container (refer to the “TRANSMISSION OIL” section in the chapter 3).

Remove the driven pulley (refer to the “DRIVE PULLEY, DRIVE BELT AND DRIVEN PULLEY” section in the chapter 8).

Remove the nine bolts from the transmission case cover, then remove the transmission case cover.

Remove the dowel pins and gasket.
Remove the final gear and shaft, then remove the countershaft.
INSPECTION

Inspect the countershaft and gear for wear or damage.

Inspect the final gear and final gear shaft for wear, damage or seizure.

Check the driveshaft for wear or damage.

Check the left crankcase bearings for excessive play and inspect the oil seal for wear or damage.
9. FINAL REDUCTION

Check the transmission case cover bearings for excessive play and inspect the final shaft bearing oil seal for wear or damage.

INSTALLATION

Install the final gear and final gear shaft.
Install the Countershaft
Install the driveshaft.
Install new gasket.
Install the two dowel pins.

Install the transmission case cover.
Install and tighten the nine bolts to the specified torque in a crisscross pattern in 2 or 3 steps.

**Torque:** 1.0~1.4kgf·m

Fill the transmission case with the specified oil (refer to the “TRANSMISSION OIL” section in the chapter 3).
**BEARING REPLACEMENT**

**TRANSMISSION CASE COVER**

Remove the transmission case cover

Remove the transmission case cover bearings by using the special tool.

**Special tool:**
- Bearing puller A120E00037

Install the new bearings or new oil seal into the transmission case cover by using the special tool.

**Special tool:**
- Oil seal and bearing installer A120E00014

**TRANSMISSION CASE**

Remove the all transmission gears (refer to the “FINAL REDUCTION REMOVAL/INSPECTION/INSTALLATION” section in this chapter).

Remove the transmission case bearings by using the special tool.

**Special tool:**
- Bearing puller A120E00037
Install the new bearings or new oil seal into the transmission case by using the special tool.

**Special tool:**
Oil seal and bearing installer

A120E00014

After installation, fill the transmission case with the specified oil.

 Specified gear oil : SAE90#

Oil capacity:

- At disassembly: 0.13 liter
- At change: 0.12 liter

Install and tighten the oil check bolt.

Torque: 0.8~1.2kgf-m
Start the engine and check for oil leaks.
SERVICE INFORMATION

GENERAL INSTRUCTIONS

• All servicing operations and inspections in this section can be made with the engine installed.
• Drain the coolant before removing the right crankcase cover.
• Be careful not to drain the coolant when the engine temperature is high. (Perform this operation when the engine is cold.)
• Drain the coolant into a clean container.
• Drain the engine oil into a clean container before removing the right crankcase cover.
• When the right crankcase cover is installed, fill with the recommended engine oil and coolant. Then, bleed air from the water jacket.
• Refer to chapter 17 for A.C. generator inspection.

SPECIFICATIONS

Engine oil: SAE 10W/40#
API-SJ Over
Oil capacity at change: 1.0 liter
Coolant: distilled water + coolant concentrate
Coolant capacity: 0.87L

SPECIAL TOOLS

Flywheel puller A120E00003
Flywheel holder A120E00021

TORQUE VALUES

Flywheel nut: 5.0~6.0 kgf-m

TROUBLESHOOTING

Refer to page chapter 17 for A.C. generator troubleshooting.

Starter motor rotates but engine does not start

• Faulty starter clutch
• Starter motor rotates reversely
• Weak battery
ALTERNATOR STATOR

REMOVAL

Drain the engine oil (refer to the “ENGINE OIL” section in the chapter 3).

Disconnect the alternator stator connectors (refer to the chapter 17).

Remove the 10 bolts from the right crankcase cover and then remove the cover.

Remove the two dowel pins and gasket.

Remove the two pulse coil mount screws. Remove the three stator mount bolts, grommet and the stator from the right crankcase cover.
**INSPECTION**

Check the stator and pulse coil for damage.

---

**INSTALLATION**

Install the stator and tighten the stator mount bolts to the specified torque.

**Torque:** 1 kgf-m

Apply sealant to the grommet seating surface and install it to the cover groove properly.

Install the pulse coil and tighten mount screws securely.

Clean the mating surfaces of the right crankcase and cover.
Install the dowel pins and gasket.

Install the right crankcase cover and tighten the bolts in a crisscross pattern in 2 or 3 steps.
10. A.C. GENERATOR/STARTER CLUTCH

STARTER CLUTCH

REMOVAL

Remove the right crankcase cover (refer to the “ALTERNATOR STATOR” section in this chapter).

Hold the flywheel with a special tool and remove the flywheel nut.

**Special tool:**
Flywheel holder A120E00021

Remove the flywheel/driven gear by using the special tool.

**Special tool:**
Flywheel puller A120E00003

Remove the reduction gear shaft and reduction gear.
Remove the starter driven gear.

**INSPECTION**

Install the driven gear into the flywheel.

Check the operation of the sprag clutch by turning the driven gear.
You should be able to turn the driven gear clockwise smoothly, but the gear should not turn counterclockwise.

Remove the starter driven gear by turning the driven gear.

Check the starter driven gear teeth for wear or damage.

Measure the starter driven gear boss O.D..

Measure the starter driven gear bushing I.D..

Check the starter reduction gear teeth and shaft for wear or damage.
INSTALLATION

Install the starter driven gear onto the crankshaft.

Apply oil to the starter reduction gear shaft. Install the starter reduction gear and shaft to the right crankcase.

Install the flywheel onto the crankshaft by aligning the key on the crankshaft with the groove in the flywheel.

* Before installation, check and make sure that the inside of the flywheel is not contaminated.
Hold the flywheel with the special tool and tighten the flywheel nut.

**Torque:** 5.0~6.0 kgf-m

**Special tool:**
Flywheel holder  A120E00021

Install the dowel pins and gasket.

Install the right crankcase cover and tighten the bolts in a crisscross pattern in 2 or 3 steps.

GENERAL INSTRUCTIONS

- This section covers crankcase separation to service the crankshaft. The engine must be removed for this operation.
- When separating the crankcase, never use a driver to pry the crankcase mating surfaces apart forcibly to prevent damaging the mating surfaces.
- When installing the crankcase, do not use an iron hammer to tap it.
- The following parts must be removed before separating the crankcase.
  - Cylinder head
  - Cylinder/piston
  - Drive and driven pulley
  - A.C. generator/starter clutch
  - Rear wheel/rear shock absorber
  - Starter motor
  - Oil pump

- Excessive bearing play
- Excessive crankpin bearing play
- Worn piston pin and piston pin hole
CRANKCASE SEPARATION

Remove the two right crankcase attaching bolts.

Remove the left crankcase bolts.

Place the crankcase with the left crankcase down and remove the right crankcase from the left crankcase.

* Never use a driver to pry the crankcase mating surfaces apart.

Remove the gasket and dowel pins.

Remove the crankshaft from the left crankcase.
Remove the oil seal from the left crankcase.

**CRANKSHAFT INSPECTION**

Measure the connecting rod big end side clearance.

Measure the connecting rod small end I.D.
Measure the crankshaft runout.

Measure the crankshaft bearing play.

CRANKCASE ASSEMBLY

Clean off all gasket material from the crankcase mating surfaces.

Avoid damaging the crankcase mating surfaces.

Install a new oil seal into the left crankcase.
11. CRANKCASE/CRANKSHAFT

Place the left crankcase down and install the crankshaft into the left crankcase.

* • Avoid damaging the oil seal.
  • Apply grease to the lip of the oil seal.

Install the two dowel pins and a new gasket.

Place the right crankcase over the crankshaft and onto the left crankcase.

* Install the right crankcase squarely and do not tap it with an iron or plastic hammer.

Install and tighten the right and left crankcase attaching bolts.

Torque: 1 kgf-m
Install the cam chain.
Install the cam chain tensioner slipper.
Install and tighten the cam chain tensioner slipper bolt.

SERVICE INFORMATION

GENERAL INSTRUCTIONS

- The water pump must be serviced after removing the engine. Other cooling system service can be done with the engine installed in the frame.
- The engine must be cool before servicing the cooling system. When the coolant temperature is over 100 °C, never remove the radiator cap to release the pressure because the boiling coolant may cause danger.
- Avoid spilling coolant on painted surfaces because the coolant will corrode the painted surfaces. Wash off any spilled coolant with fresh water as soon as possible.
- After servicing the system, check for leaks with a cooling system tester.

Cautions for Using Coolant:
- Use coolant of specified mixing rate. (The mixing rate of 425cc KYMCO SIGMA coolant concentrate + 975cc distilled water is 30%.)
- Do not mix coolant concentrate of different brands.
- Do not drink the coolant which is poisonous.
- The freezing point of coolant mixture shall be 5 °C lower than the freezing point of the riding area.
COOLING SYSTEM TESTING

RADIATOR CAP INSPECTION

* Removing the radiator cap while the engine is hot can cause the coolant to spray out, seriously scalding you.

Always let the engine and radiator cool down before removing the radiator cap.

Remove the radiator cap (1).

Pressure test the radiator cap. Replace the radiator cap if it does not hold pressure, or if relief pressure is too high or too low. It must hold the specified pressure for at least six seconds.

* Before installing the cap in the tester, wet the sealing surface.

Radiator Cap Relief Pressure:
90 kPa (0.9 kg/cm², 12.8 psi)

Pressurize the radiator, engine and hoses, and check for leaks.

* Excessive pressure can damage the cooling system components. Do not exceed 105 kPa (1.05 kg/cm², 14.9 psi).

Repair or replace components if the system will not hold the specified pressure for at least six seconds.
COOLANT REPLACEMENT

PREPARATION

- The effectiveness of coolant decreases with the accumulation of rest or if there is a change in the mixing proportion during usage. Therefore, for best performance change the coolant regularly as specified in the maintenance schedule.
- Mix only distilled, low mineral water with the antifreeze.

Recommended mixture:
1:1 (Distilled water and antifreeze)

REPLACEMENT/AIR BLEEDING

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

* When filling the system or reserve tank with coolant (checking the coolant level), place the scooter in a vertical position on a flat, level surface.

Remove the radiator cap (1).

Remove the drain bolt (2) and drain the coolant from the system.
12. COOLING SYSTEM

Remove the screw (3) and reserve tank lid (4).

Remove the reserve tank cap (5) and drain the coolant from the reserve tank.

Reinstall and tighten the drain bolt securely.

Fill the reserve tank to the upper level line (6).
Fill the system with the recommended coolant through the filler opening up to the filler neck (1).

Bleed air from the system as follow:
1. Start the engine and let it idle for 2–3 minutes.
2. Snap the throttle three to four times to bleed air from the system.
3. Stop the engine and add coolant to the proper level if necessary. Reinstall the radiator cap.
4. Check the level of coolant in the reserve tank and fill to the upper level if it is low.
RADIATOR

REMOVAL

Drain the coolant (see page 12-5).

Disconnect the siphon hose (1) and air bleed hose (2).

Remove the nut(3).

Loosen the hose bands, then disconnect the output radiator hose (4) and input radiator hose (5) from the radiator.

Disconnect the fan motor switch connectors (6).

Disconnect the fan motor connector (7).
12. COOLING SYSTEM

Remove the three nuts (10) and then remove the radiator from frame.

INSTALLATION

Installation is in the reverse order of removal.

Refill the coolant (refer to the “COOLANT REPLACEMENT” section in this chapter).
12. COOLING SYSTEM

FAN MOTOR

REMOVAL

Remove the radiator (refer to the “RADIATOR” section in this chapter)

Remove the three mounting bolts (1) and then remove the fan motor (2)

INSPECTION

Check the fan motor to operate using an available battery.

INSTALLATION

Installation is in the reverse order of removal.
FAN MOTOR SWITCH

REMOVAL

Disconnect the fan motor switch connectors (refer to the “RADIATOR” section in this chapter).

Remove the fan motor switch (1).

INSPECTION

Place the fan motor switch in oil contained in a pan as shown and raise the oil temperature gradually to check for the temperature at which the switch starts to operate.

If the switch operating temperature is not within the specified range, replace the switch with a new one.

</table>

*  
- Handle the cooling fan motor switch carefully as it is vulnerable to impact.
- Do not allow the cooling fan motor switch and the thermometer to come in contact with the bottom of the pan.

INSTALLATION

Fit the new O-ring.

Tighten the cooling fan motor switch to specified torque.

Torque: 1.8 kgf-m (18 N-m, 13 lbf-ft)

*  
- Replace the O-ring a new one.
- Do not coat grease to the O-ring.
12. COOLING SYSTEM

WATER PUMP

MECHANICAL SEAL (WATER SEAL) INSPECTION

Inspect the telltale hole for signs of mechanical seal coolant leakage. If the mechanical seal is leaking, remove the right crankcase cover and replace the mechanical seal.

WATER PUMP/IMPELLER REMOVAL

Drain the coolant (see page 12-5).

Remove the coolant inlet hose and outlet hose.
12. COOLING SYSTEM

Remove the four bolts and the water pump cover, gasket and 2 dowel pins.

Remove the water pump impeller.

* The impeller has left hand threads.

Inspect the mechanical (water) seal and seal washer for wear or damage.

* The mechanical seal and seal washer must be replace as a set.
WATER PUMP SHAFT REMOVAL

Disconnect the water hose from the right crankcase cover.
Remove the 5 bolts attaching the water pump assembly.
Remove the water pump assembly, gasket and dowel pins.

Remove the water pump shaft clip and water pump shaft.
Install the dowel pins and a new gasket and then install the water pump assembly to the right crankcase cover. Tighten the 5 bolts to secure the water pump assembly.

* When installing the water pump assembly, aligning the groove on the water pump shaft with the tab on the oil pump shaft.

**WATER PUMP/IMPELLER INSTALLATION**

When the mechanical seal is replaced, a new seal washer must be installed to the impeller.
12. COOLING SYSTEM

Install the impeller onto the water pump shaft.
**Torque:** 1.2 kgf-m (12 N-m, 9 lbf-ft)

* The impeller has left hand threads.

Install the two dowel pins and a new gasket.

Install the water pump cover and tighten the 4 bolts.

**Torque:** 1 kgf-m (10 N-m, 7 lbf-ft)
12. COOLING SYSTEM

WATER TEMPERATURE SENSOR (METER’S COOLANT TEMPERATURE GAUGE)

REMOVAL

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).
Drain the coolant (refer to the “COOLANT REPLACEMENT” section in this chapter).

Disconnect the water temperature sensor connectors (1).
Remove the water temperature sensor (2) from thermostat.

INSPECTION

Connect the water temperature sensor to the ohmmeter and dip it in oil contained in a pan which is placed on an electric heater.
Gradually raise oil temperature while reading the thermometer in the pan and the ohmmeter connected. If the resistance measured is out of specification, replace the temperature gauge with a new one.

* • Handle the water temperature sensor carefully as it is vulnerable to impact.
• Do not allow the water temperature sensor and the thermometer to come in contact with the bottom of the pan.
12. COOLING SYSTEM

INSTALLATION

With thread lock applied to the threaded part, tighten the water temperature sensor.

**Torque:** 0.8 kgf-m (8 N-m, 5.8 lbf-ft)

Connect the sensor connectors.

After the water temperature sensor has been installed, fill coolant and perform air bleeding (refer to the “COOLANT REPLACEMENT” section in this chapter).
12. COOLING SYSTEM

THERMOSTAT

THERMOSTAT REMOVAL

REMOVAL

Drain the coolant (refer to the “COOLANT REPLACEMENT” section in this chapter).

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the water hose (1) from the thermostat housing.

Remove the mounting bolt (2) and the thermostat housing from the cylinder head.

INSTALLATION

The installation sequence is the reverse of removal.

After the water thermostat has been installed, fill coolant and perform air bleeding (refer to the “COOLANT REPLACEMENT” section in this chapter).
DISASSEMBLY

Remove the two bolts and separate the thermostat housing halves.

Remove the thermostat from the thermostat housing.
INSPECTION

Suspend the thermostat in a pan of water over a burner and gradually raise the water temperature to check its operation.

Refer to standard specifications on page 18-9.

Press the "Down" button to enter page 02.

The figure includes TPS position, TPI idle adapted voltage and TPI WOT adapted (Throttle grip fully opened).

Refer to standard specifications on page 18-9.

Press the "Down" button to enter page 03.

The figure includes engine working temperature, atmosphere pressure and manifold pressure.

Refer to standard specifications on page 18-9.

Press the "Down" button to enter page 04.
The figure includes fuel injector interval, ignition advance angle and ABV angle.

Refer to standard specifications on page 18-9.

Press the " Down " button to enter page 05.

The figure includes O2 sensor voltage, O2 heater working condition and O2 correction.

Refer to standard specifications on page 18-9.

Press the " Down " button to enter page 06.

The figure includes rollover voltage.

Refer to standard specifications on page 18-9.

Press the " Down " button to enter page 07.

The figure includes ECU counter hours.

Press the " UP " button to the first page.
ADJUST

Need to make TPI/ABV reset to operate after changing new ECU and clean THROTTLE BODY and changing the engine department product, let ECU set up and set up initially.

Choose "Adjust"

Press the "Enter" button to TPI/ABV Reset

Press the "Enter" button

Please key switch off then key switch on
Completed the TPI/ABV reset operate.

Before Maintaining

Before maintaining the injection vehicles you have to notice something as follow,

1. Never to dismantle the wire of battery connector while engine is running, or the ECU will be destroyed.

2. Never dismantle the ECU while engine is running, or the ECU will be destroyed.

3. Be sure to use the anti-interfere spark plug.

4. Be sure to relieve the fuel pressure before removing fuel pump or fuel hose.
How To Maintain Injection Vehicles

1. CELP

2. COMPONENT EXAMINE

3. PDA(1) or KYMCO Fi diagnostic tool(2) and pc software(3)

   (1) CELP (Check Engine Lamp)
   (2) Update DTool 5042 version
   (3) 2.15 or 2.16 version

Diagnostic Tool Connector
CELP (Engine Check Lamp)

When turning on the switch, the lamp will be lighted for 2 seconds then off. Let user to know the lamp is available and connect to ECU.

But after then or during riding, if the CELP start to blink or keep lighting, it means something wrong with this vehicle, you better do the further check to find out the failure code to know which part get trouble.
There are 3 kinds of priority grade let user to know what kind of trouble was happened.

Priority grade 1: CELP blinks continuously. This is the most emergent situation like engine over heat. User better slow down the riding and go to dealer for checking.

Priority grade 2: CELP lights all the time. It means components get trouble or circuit something wrong. Do the further check to find out the failure code to know which part get trouble.

Priority grade 3: CELP just blinks once suddenly and then disappear. It sometimes just warning like the RPM was too high in a short term.
How To Show Failure Code

You can read the failure code by as below:

Turn switch on. The CELP will be lighted for 2 seconds then off. The CELP start to blink to show the failure codes (the number of blinks from 1 to 25).

If vehicle got more than one failure code, the CELP will be shown from lower number failure code and then show the other higher number one after four seconds. All the failure codes would be shown repeatedly.

Reset Failure Code

After repairing the trouble, you should clear the failure code or it will still exist in the ECU memory. When you maintain this vehicle next time, it will show again and you get confuse.

1. Turn switch on. The CELP will be lighted for two seconds then off.

2. The CELP begins to blink to show the failure codes.

3. The self-diagnosis memory data will be erased when all the failure codes has showed for four cycles.
Maintaining By Checking Component

ECU (Engine Control Unit)

Outlook checking

Voltage inspection

Connect the meter (+) probe to the F4(R/W) wire and the meter (-) probe to the H4(G/B) wire to measure the voltage.

MAP content (edition issue no.)

Performance confirmed

Model name: LFA7
Calibrate: 04LFA7QKAA
Software: QK0700

Connect the meter (+) probe to the F4(R/W) wire and the meter (-) probe to the H4(G/B) wire to measure the voltage.
**Maintaining By Checking Component**

**FUEL PUMP**

Connect the meter (+) probe to the red/black wire and the meter (-) probe to the green wire to measure the voltage from the ECU input to fuel pump unit.

**Standard : 8~16 V** (Battery volt)

Measure the resistance of the fuel pump to see if it is short circuit or not.
Maintaining By Checking Component

**T-MAP (Manifold Air Temperature Pressure) Sensor**

Connect the PDA or KYMCO Fi diagnostic tool.

Into the Data Analyze item.

Check if the manifold pressure data is malfunction.

(Key switch is ON but engine is not start)

If data was incorrect.

It is possible T-map sensor is not normal.

**Standard**: 101.3 ± 3 kpa
Maintaining By Checking Component

**TPS (Throttle Position Sensor)**

Connect the PDA or KYMCO Fi diagnostic tool.

Into the Data Analyze item.

Check if the TPS position data is malfunction.

(Key switch is ON but engine is not start)

If data was incorrect (Idle and throttle fully)

It is possible TPS is not normal.

**Standard**: Idle ~0 ° voltage ~0.23V ±0.05

Throttle fully ~90° over voltage ~3.27V over
Maintaining By Checking Component

**WTS (Water Temperature Sensor)**

Connect the meter (+) probe to the V/G wire and the meter (-) probe to the G/L wire to measure the voltage.

**Standard**: $5 \pm 0.25 \text{ V}$

Measure the resistance of the WTS (Water Temperature Sensor).

**Standard (20°C/68°F)**: $2.075 \pm 10\% \text{ kΩ}$
**Maintaining By Checking Component**

**INJECTOR**

Measure the resistance of the Injector

Standard ($20^\circ$C/$68^\circ$F): 10.6~15.9 Ω
Maintaining By Checking Component

**O2 SENSOR**

Measure the resistance of the O2 sensor heater. (2 white wire pin)

**Standard (20°C/68°F): 6.7 ~9.5 Ω**

Connect the PDA or KYMCO Fi diagnostic tool.

Into the Data Analyze item .

Check Page 05

(Key switch ON then start engine until O2 heater activation is ON)

If data was incorrect.

It is possible O2 sensor is not normal
**ROLL SENSOR**

The engine should be stall when the vehicle incline over 65° for safety. When you place the vehicle back to normal situation, you have to key-off and key-on the switch, then it can be restarted.

**Standard:**
- Normal: 0.4~1.4V
- OVER 65°: 3.7~4.4 V

Maintaining Special Notice

While dismantling the injector, remember to notice that replace those 2 O-rings with new and apply some oil before mount them, never damage the O-ring while mounting it, otherwise it will cause seal insufficient and incorrect injection.

Remove the fuel injector from the fuel pipe.

Frist fuel pipe must hasn’t pressure then remove it

STEP 1 : Disconnect the fuel pump relay or fuel pump connector.

STEP 2: key switch on: Start the engine still engine stop.
Maintaining Special Notice

Never adjust those two TP screws, those were adjusted to be the best condition by KYMCO, if change this condition it may cause instable riding.
Maintaining Special Notice

2. Connect the PDA or KYMCO Fi diagnostic tool. Into the Data Analyze item. Check if the ignition advance data is malfunction. (Key switch is ON then start engine until 80 °C) If data was over 20 ° you can adjustment the air bypass adjustment screw 1~1.5 circle.(counterclockwise) Don’t adjust the air bypass adjustment screw over 1.5 circle.
Maintaining Special Notice

The timing of cleaning throttle body:

- While riding the vehicle a period of time, throttle body will get some carbon inside, at that moment ABV (Air Bypass Valve) will offset air to make the idle speed stable, but if ABV open over 180°, it won’t be useful and cause some problem like idle speed instable.

- Keep looking on diagnostic Tool signal page ABV Angle (°), if the value is over 180°, you have to clean the throttle body.

- While maintaining vehicle like change oil, if the ABV Angle (°) is over 140°, to clean the throttle body is recommended.
3. **TPI and ABV Initialization Method**

After replacing throttle body or engine overhauled, it will change the efficiency of air intake so must be do the TPI/ABV initialization process.

- When the vehicle is started, turn off the ignition and Key On again (do not start the engine).
- Use test rod or wire clip short Reset (pink) wire to short with negative of battery or the earthing of frame to complete TPI ABV resetting.
- Precautions:
  ~1. After short, remove test rod or wire clip. Never let it connected all the time.
  ~2. Do not break the PVC sleeve of Reset wire.

GENERAL INSTRUCTIONS

- Remove the motorcycle frame covers before removing the front wheel, steering handlebar, front shock absorber and front fork. Jack the motorcycle front wheel off the ground and be careful to prevent the motorcycle from falling down.
- During servicing, keep oil or grease off the brake pads and brake disk.

TROUBLESHOOTING

Hard steering (heavy)
- Excessively tightened steering stem top cone race
- Broken steering balls
- Insufficient tire pressure

Steers to one side or does not track straight
- Uneven front shock absorbers
- Bent front fork
- Bent front axle or uneven tire

Poor brake performance
- Worn brake pads
- Contaminated brake pad surface
- Deformed brake disk
- Air in brake system
- Deteriorated brake fluid
- Worn brake master cylinder piston oil seal
- Clogged brake fluid line
- Unevenly worn brake caliper

Front wheel wobbling
- Bent rim
- Loose front axle
- Bent spoke plate
- Faulty tire
- Improperly tightened axle nut

Soft front shock absorber
- Weak shock springs
- Insufficient damper oil

Front shock absorber noise
- Slider bending
- Loose fork fasteners
- Lack of lubrication
HANDLEBAR

REMOVAL

Remove the lower handlebar cover and front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Remove the two bolts (1) and disconnect the brake light switch wire (2), then remove the rear brake master cylinder.
Remove the two bolts (3) and disconnect the brake light switch wire (4), then remove the front brake master cylinder.

Remove the inner cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Remove the handlebar lock nut (5) and take out the bolt (6).
Remove the handlebar and collar (7).
INSTALLATION

Install the handlebar onto the steering stem and install the handlebar collar, lock nut and bolt. Tighten the bolt to the specified torque.

**Torque**: 4.5 kgf-m (45 N-m, 32 lbf-ft)

Install the front and rear master cylinders and connect the brake light switch wires (refer to the “BRAKE MASTER CYLINDER” section in this chapter and chapter 15).

* Adjust the throttle grip free play to the specified range of 2~6 mm (0.08~0.24 in).
DISASSEMBLY

Remove the two screws (1) from right handlebar switch.

Disconnect the throttle cable (2) from the throttle grip.
Remove the right handlebar switch.

Remove the two screws (3) and then remove the left handlebar switch.
ASSEMBLY

Install the left handlebar switch.

* Align the pin on the left handlebar switch with the hole on the handlebar.

Install and tighten the two screws securely.

Install the right handlebar switch.

* Align the pin on the right handlebar switch with the hole on the handlebar.

Lubricate the throttle grip front end with grease and then connect the throttle cable to the throttle grip.

Install and tighten the two screws.
FRONT WHEEL

REMOVAL
Jack the scooter front wheel off the ground. Remove the bolt (1), then pull out the axle (2). And (3) Remove the front wheel and collar.

Axle runoutn inspection
Set the axle in V blocks and measure the runout using a dial gauge. The actual runout is 1/2 of the total indicator reading. Service Limit: 0.2 mm (0.008 in)

Wheel rim inspection
Check the wheel rim runout.
Apply grease to the collar (1), then install the collar onto the wheel.

Install the speedometer speed wheel sensor
DISASSEMBLY

Remove the side collar (1) and dust seal (2).

Turn the inner race of each bearing with your finger to see if they turn smoothly and quietly. Also check if the outer race fits tightly in the hub. Replace the bearings if the races do not turn smoothly, quietly, or if they fit loosely in the hub.

Remove the front wheel bearing (3) by using the special tool.

**Special tool:**
Bearing puller A120E00037

Remove the distance collar (4) from wheel.
Remove the front wheel bearing (5) by using the special tool.

**Special tool:**
Bearing puller A120E00037

**ASSEMBLY**

Install the front wheel bearing (5) by using the special tool.

**Special tool:**
Bearing installer A120E00014

Install the distance collar.

Install the front wheel bearing (5) by using the special tool.

**Special tool:**
Bearing installer A120E00014

Apply grease to the collar, then install the collar onto the wheel.
FRONT BRAKE FLUID

Check

Brake fluid:
Brake hose:
Cracks/wear/damage → Replace.
Apply the brake lever several times.
Fluid leakage → Replace.
Brake hose clamp:
Loosen → Tighten

FLUID REPLACEMENT/AIR BLEEDING

* A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
* Do not allow foreign material to enter the system when filling the reservoir.
* Avoid spilling brake fluid on painted, plastic or rubber parts. Place a rag over these parts whenever the system is serviced.

Once the hydraulic system has been opened, or if the brake feels spongy, the system must bled. When using a commercially available brake bleeder, follow the manufacturer’s operating instructions.
Brake fluid draining

Make sure that the master cylinder parallel to the ground, before removing the reservoir cover.

Remove the two screws (1).

Remove the reservoir cover, diaphragm plate and diaphragm.

Connect a bleed hose to the bleed valve.
Loosen the bleed valve and pump the brake lever. 
Stop operating the brake when no more fluid flows out of the bleed valve.

**Brake fluid filling/Air bleeding**

* Do not mix different types of fluid since they are not compatible.

Fill the master cylinder with DOT 4 brake fluid to the upper level.

Connect a commercially available brake bleeder to the front caliper bleed valve.

Check the fluid level often while bleeding the brake to prevent air from being pumped into the system.
When using a brake bleeding tool, follow the manufacturer’s operating instructions.

* If air enters the bleeder from around the bleed valve threads, seal the threads with teflon tape.

Pump the brake bleeder and loosen the front caliper bleed valve. Add fluid when the fluid level in the master cylinder is low to prevent drawing air into the system.
Repeat the above procedures until no air bubbles appear in the plastic hose.

Close the front caliper bleed valve and operate the front brake lever.
If it still spongy, bleed the system again.
If the brake bleeder is not available, perform the following procedure.

Pump up the system pressure with the brake lever until these are not air bubbles in the fluid flowing out of the reservoir small hole and lever resistance is felt.

1. Pump the brake lever several times, then squeeze the brake lever all the way and loosen the bleed valve 1/4 turn. Wait several seconds and close the bleed valve.

* Do not release the brake lever until the bleed valve has been closed.

2. Release the brake lever slowly until the bleed valve has been closed. Add fluid when the fluid level in the master cylinder is low to prevent drawing air into the system.

3. Repeat the steps 1 - 2 until there are no air bubbles in the bleed hose.

After bleeding air completely, tighten the bleed valve to the specified torque.

**Torque:** 6 N•m (0.6 kgf•m, 4.3 lbf•ft)

Fill the reservoir to the casting ledge with DOT 4 brake fluid to the upper level.

Install the diaphragm, set plate and reservoir cover and tighten the screws to the specified torque.

**Torque:** 2 N•m (0.2 kgf•m, 1.1 lbf•ft)
FRONT BRAKE PAD

BRAKE PAD REPLACEMENT

Remove the pad pins (1).
Remove the two caliper mounting bolts (2), then remove the caliper.

Remove the brake pads.

*Always replace the brake pads in pairs to ensure even disc pressure.*
Install new pads so that their ends rest on the pad retainer on the brake properly.

Install the pad pin by pushing the pads against the pad spring to align the pad pin holes in the pads and caliper.

Install the front caliper onto the fork leg and then install and tighten the new two caliper mounting bolts to the specified torque.

**Torque:** 35 N-m (3.5 kgf-m)

Tighten 1 pad pins to the specified torque.

**Torque:** 18 N-m (1.8 kgf-m, 13 lbf-ft)
BRAKE DISC INSPECTION

Visually inspect the brake disc for damage or cracks.

Measure the brake disc thickness.

**Service limits:** 3 mm (0.12 in)

Replace the brake disc if the smallest measurement is less than the service limit.

Measure the brake disc warpage.

**Service limits:** 0.3 mm (0.012 in)
FRONT SHOCK ABSORBER

REMOVAL

Remove the front cover and front fender. (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).
Remove the front brake caliper (refer to the “FRONT BRAKE PAD” section in this chapter).
Remove the front wheel (refer to the “FRONT WHEEL” section in this chapter).

Remove the speed wheel sensor bolt (1) and then remove the brake hose guide from right front shock absorber.

Remove the speedometer cable guide from left front shock absorber.

Remove the two mounting bolts (2) and then remove the right front shock absorber.
Remove the two mounting bolts (3) and then remove the left front shock absorber.

INSTALLATION

Installation is in the reverse order of removal.

* Tighten the shock absorber mounting bolt to the specified torque.

** Torque: 3.2 kgf-m (32 N-m, 23 lbf-ft)

INSPECTION

Inspect the following items and replace if necessary.
• Front shock absorber tube bending, damage or wear
• Weak front shock absorber spring
• Damper and damper rod bending
• Oil seal damage or wear
STRAIGHT STEERING STEM

REMOVAL

Remove the steering handlebar (refer to the “HANDLEBAR” section in this chapter).
Remove the front shock absorber (refer to the “FRONT SHOCK ABSORBER” section in this chapter).

Remove the front brake hose and speed wheel Sensor connector (1) from the guide.

Hold the steering stem top cone race and remove the steering stem lock nut by using the special tool.

Special tool:
Lock nut wrench A120F00002

Remove the top cone race and washer remove the steering stem.

* Be careful not to lose the steel balls (26 on top race and 19 on bottom race).

Lock nut wrench A120F00023
Inspect the ball races, cone races and steel balls for wear or damage. Replace if necessary.

- Remove the top balls.
- Remove the upper ball race by using a chisel if necessary.

- Remove the bottom balls.
- Remove the bottom ball race by using a pipe if necessary.

- Remove the bottom cone race by using a chisel if necessary.

*Be careful not to damage the steering stem.*
INSTALLATION

Install the new bottom cone race onto the steering stem.
Install the new upper and bottom ball races into the frame.
Apply grease to the top and bottom ball races and install new steel balls on the top ball race and new steel balls on the bottom ball race. Install the steering stem.

Apply grease to the top cone race and install it.
Tighten the top cone race and then turn the steering stem right and left several times to make steel balls contact each other closely.

* Check that the steering stem rotates freely without vertical play.

Lock nut wrench A120F00023

Install the steering stem lock nut and tighten it to the specified torque by using the special tool while holding the top cone race.

16. REAR BRAKE/REAR FORK/REAR WHEEL/REAR SHOCK ABSORBER

REAR BRAKE

REAR BRAKE CALIPER REMOVAL
First remove the exhaust muffler.
Remove the rear brake fluid tube bolt and disconnect the brake fluid tube.
Remove two bolts attaching the rear brake caliper.
Remove the rear brake caliper.

* When removing the brake fluid tube, use shop towels to cover plastic parts and coated surfaces to avoid damage.

INSPECTION
Inspect the brake pads and brake disk.
Measure the brake disk thickness.

Visually check the brake pad thickness

DISASSEMBLY
Remove two brake pads dowel pins and three bolts from the brake caliper.
Remove the brake pads.
Remove the piston from the brake caliper. If necessary, use compressed air to squeeze out the piston through the brake fluid inlet opening and place a towel under the caliper to avoid contamination caused by the removed piston. Check the piston cylinder for scratches or wear and replace if necessary.

Push the piston oil seal outward to remove it. Clean the oil seal groove with brake fluid.

* Be careful not to damage the piston surface.

Check the piston for scratches or wear. Measure the piston O.D. with a micrometer gauge.

Check the caliper cylinder for scratches or wear and measure the cylinder bore.
ASSEMBLY

Clean all removed parts.

Apply silicon grease to the piston and oil seal.

Lubricate the brake caliper cylinder inside wall with brake fluid.

Install the brake caliper piston with grooved side facing out.

* Install the piston with its outer end protruding 3 ~ 5mm beyond the brake caliper.

Install the two spring plates onto the groove of the caliper.

* Make sure the spring plate next to the brake pad dowel pin orientation.

Install two brake pads and brake pad dowel pin.
16. REAR BRAKE/REAR FORK/REAR WHEEL/REAR SHOCK ABSORBER

**INSTALLATION**

Install the brake caliper to the rear fork and tighten the two bolts.

**Torque:** 27 N-m

Connect the brake fluid tube to the brake caliper and install fluid tube bolt, copper washers and tighten the fluid tube bolt.

Fill the brake reservoir with the specified brake fluid and bleed air from the brake system.

| * When installing the brake fluid tube, be sure to install the two copper sealing washers. |

**REAR FORK**

**REMOVAL**

Remove the exhaust muffler.

Remove the rear brake caliper.

Remove the right rear shock absorber lower mount bolt.

Remove the rear axle nut and remove the collar.

Remove the rear fork.

The installation sequence is the reverse of removal.

Turn the inner race of each bearing with your finger to see if they turn smoothly and quietly.

Also check if the outer race fits tightly in the hub.

Replace the bearings if the races do not turn smoothly, quietly, or if they fit loosely in the hub.
REAR WHEEL
REMoval
Remove the exhaust muffler.
Remove the rear brake caliper.
Remove the rear fork.
Remove the rear axle collar.
Remove the rear wheel.

INspection
Measure the rear wheel rim runout.

INstallATION
The installation sequence is the reverse of removal.
Torque:
- Rear shock absorber lower mount bolt: 35 ~ 45N-m
- Rear axle nut: 120 N-m

REAR SHOCK ABSORBER
REMoval
Remove the met-in box and carrier.
Remove the body cover, center cover and rear fender A together.
Remove the right/left rear shock absorber upper and lower mount bolts.
Remove the right and left rear shock absorbers.
16. REAR BRAKE/REAR FORK/REAR WHEEL/REAR SHOCK ABSORBER

INSTALLATION
Install the rear shock absorbers in the reverse order of removal.

Torque:
Upper Mount Bolt: 40 N-m
Lower Mount Bolt: 40 N-m

Suspension
Each shock absorber on your scooter has 5 spring preload adjustment positions for different load or riding conditions.

Use a pin spanner to adjust the rear shock spring preload. Position 1 is for light loads and smooth road conditions. Position 3 to 5 increase spring preload for a stiffer rear suspension and can be used when the scooter is heavily loaded. Be certain to adjust both shock absorbers to the same spring preload positions.

Standard spring preload position: 3

⚠️ CAUTION
Always adjust the shock absorber pre-load position in sequence (1-2-3-4-5 or 5-4-3-2-1). Attempting to adjust directly from 1 to 5 or 5 to 1 may damage the shock absorber.

SERVICE INFORMATION

GENERAL INSTRUCTIONS

* The battery electrolyte (sulfuric acid) is poisonous and may seriously damage the skin and eyes. Avoid contact with skin, eyes, or clothing. In case of contact, flush with water and get prompt medical attention

- The battery can be charged and discharged repeatedly. If a discharged battery is not used for a long time, its service life will be shortened. Generally, the capacity of a battery will decrease after it is used for 2~3 years. A capacity-decreased battery will resume its voltage after it is recharged but its voltage decreases suddenly and then increases when a load is added.
- When a battery is overcharged, some symptoms can be found. If there is a short circuit inside the battery, no voltage is produced on the battery terminals. If the rectifier won’t operate, the voltage will become too high and shorten the battery service life.
- If a battery is not used for a long time, it will discharge by itself and should be recharged every 3 months.
- A new battery filled with electrolyte will generate voltage within a certain time and it should be recharged when the capacity is insufficient. Recharging a new battery will prolong its service life.
- Inspect the charging system according to the sequence specified in the Troubleshooting.
- Do not disconnect and soon reconnect the power of any electrical equipment because the electronic parts in the regulator/rectifier will be damaged. Turn off the ignition switch before operation.
- It is not necessary to check the MF battery electrolyte or fill with distilled water.
- Check the load of the whole charging system.
- Do not quick charge the battery. Quick charging should only be done in an emergency.
- Remove the battery from the motorcycle for charging.
- When replacing the battery, do not use a traditional battery.
- When charging, check the voltage with an electric tester.

BATTERY

REMOVAL/INSTALLATION

The battery is in the battery box below seat.

1. Remove the seat.

2. Remove the met-in box

3. Remove the four screws and then remove the battery retainer (2).

4. Pull battery out to expose the terminal leads

5. Disconnect the negative (-) terminal lead (3) from the battery first, then disconnect the positive (+) terminal lead (4).

6. Remove the battery from the battery box.

Battery installation:

Install in the reverse order of the removal.

* When install the battery, first connect the positive (+) cable and then negative (-) cable to avoid short circuit.
17. BATTERY/CHARGING SYSTEM

VOLTAGE INSPECTION

Remove the battery cover (last page).

Measure the battery voltage using a commercially available digital multimeter.

Voltage (20°C/68°F):
- Fully charged: 13.1 – 13.2 V
- Under charged: below 12.3 V

BATTERY CHARGING

Remove the battery

Connect the charger positive (+) cable to the battery positive (+) terminal.
Connect the charger negative (-) cable to the battery negative (-) terminal.

* Turn the power ON/OFF at the charger, not at the battery terminals.

Charging current time:

- Standard: 10 A/5 – 10 hours
- Quick: 10 A/0.5 hours

Quick charging should only be done in an emergency; slow charging is preferred. For battery charging, do not exceed the charging current and time specified on the battery. Using excessive current or extending the charging time may damage the battery.
CHARGING SYSTEM

INSPECTION

Remove the battery cover (see page 17-4).

CURRENT LEAKAGE TEST

Turn the ignition switch OFF, disconnect the negative (-) cable from the battery.
Connect the ammeter (+) probe to the negative (-) cable and the ammeter (-) probe to the battery (-) terminal.
With the ignition switch OFF, check for current leakage.
When measuring current using a tester, set it to a high range, and then bring the range down to an appropriate level. Current flow higher than the range selected may blow out the fuse in the tester.
While measuring current, do not turn the ignition switch ON. A sudden surge of current may blow out the fuse in the tester.

Specified current leakage: 5 mA max.

If current leakage exceeds the specified value, a shorted circuit is likely.
Locate the short by disconnecting connections one by one and measuring the current.
17. BATTERY/CHARGING SYSTEM

CHARGING VOLTAGE INSPECTION

Be sure that the battery is in good condition before performing this test.

* Do not disconnect the battery or any cable in the charging system without first switching off the ignition switch. Failure to follow this precaution can damage the tester or electrical components.

Start the engine and warm it up to the operating temperature; stop the engine.
Connect the multimeter between the positive and negative terminals of the battery.

To prevent short, make absolutely certain which are the positive and negative terminals or cable.

With the headlight on and turned to the high beam position, restart the engine.
Measure the voltage on the multimeter when the engine runs at 5000 min⁻¹ (rpm).

Standard:
Measured battery voltage (page 17-5) <
Measure charging voltage (see above)
<15.5 V
REGULATOR/RECTIFIER

WIRE HARNESS INSPECTION

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the regulator/rectifier connectors (1).
Check the connectors for loose contacts of corroded terminals.

Battery line

Measure the voltage between the Red/White wire terminal and ground. There should be battery voltage at all times.
17. BATTERY/CHARGING SYSTEM

Ground line

Check the continuity between the Green wire terminal and ground. There should be continuity at all times.

Charging coil line

Measure the resistance between each Yellow wire terminals.

Standard: 0.4 – 0.6 Ω (20ºC/68ºF)

Disconnect the regulator/rectifier connector.

Check for continuity between each Yellow wire terminal regulator/rectifier side and ground. There should be no continuity.
REMOVAL/INSTALLATION

Remove the side body cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the regulator/rectifier connectors (1).

Remove the two bolts (2), regulator/rectifier (3).

Installation is in the reverse order of removal.

SERVICE INFORMATION

GENERAL INSTRUCTIONS
Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is “ON” and current is present.

● When servicing the ignition system, always follow the steps in the troubleshooting.
● The ignition timing cannot be adjusted since the ignition control module is factory preset.
● The ignition control module or ECU may be damaged if dropped. Also, if the connector is disconnected when current is flowing, the excessive voltage may damage the ignition control module or ECU. Always turn off the ignition switch before servicing.
● A faulty ignition system is often related to poor connections. Check those connections before proceeding.
● Make sure the battery is adequately charged. Using the starter motor with a weak battery results in a slower engine cranking speed as well as no spark at the spark plug.
● Use a spark plug of the correct heat range. Using spark plug with an incorrect heat range can damage the engine.
● See chapter 10 for ignition pulse generator removal/installation.
● See chapter 14 for ECU removal/installation/inspection.
● See section 20 for those components: Ignition switch, Engine stop switch

TROUBLESHOOTING

LOW PEAK VOLTAGE
- Cranking speed is too low (battery is undercharged).
- Poorly connected connectors or an open circuit in the ignition system.
- Faulty ignition-coil.
- Faulty ignition control module.

NO PEAK VOLTAGE
- Short circuit in engine stop switch or ignition switch wire.
- Faulty engine stop switch or ignition switch.
- Loose or poorly connected ignition control module connectors.
- Open circuit or poor connection in ground wire of the ignition control module.
- Faulty ignition pulse generator.
- Faulty ignition control module.

PEAK VOLTAGE IS NORMAL, BUT NO SPARK JUMPS AT THE PLUG
- Faulty spark plug or leaking ignition coil secondary current.
- Faulty ignition coil.
IGNITION SYSTEM

IGNITION COIL INSPECTION

IGNITION COIL PRIMARY PEAK VOLTAGE

Remove the center cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Check cylinder compression and check that the spark plug (1) is installed correctly in the cylinder.

Disconnect the spark plug cap (2) from the spark plug.

Turn the ignition switch to “ON” and engine stop switch ON and side stand is up.
Connect the multimeter (+) probe to the black wire and the multimeter (-) to the body ground.
Check for initial voltage at this time.
The battery voltage should be measured.
If the initial voltage cannot be measured, check the power supply circuit.
IGNITION PULSE GENERATOR INSPECTION

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the ignition pulse generator connector (1).

Measure the ignition pulse generator resistance between the Green/White wire and Blue/Yellow wire.

**Standard:**

96~144Ω (20°C/68°F)
IGNITION SYSTEM

IGNITION COIL REMOVAL/INSTALLATION

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the spark plug cap from the spark plug (1).

Disconnect the ignition coil primary connector (2).
Remove the two bolts (3) and the ignition coil (4).

Installation is in the reverse order of removal.

SERVICE INFORMATION

GENERAL INSTRUCTIONS

• The removal of starter motor can be accomplished with the engine installed.
• For the starter clutch removal, refer to the chapter 10.
• After the starter clutch is installed, be sure to add the engine oil and coolant and then bleed air from the cooling system.

TORQUE VALUES

Starter motor mounting bolt 1 kgf-m (10 N-m)

TROUBLESHOOTING

Starter motor won’t turn
• Fuse burned out
• Weak battery
• Faulty ignition switch
• Faulty starter clutch
• Faulty front or rear stop switch
• Faulty starter relay
• Poorly connected, broken or shorted wire
• Faulty starter motor

Lack of power
• Weak battery
• Loose wire or connection
• Foreign matter stuck in starter motor or gear

Starter motor rotates but engine does not start
• Faulty starter pinion
• Starter motor rotates reversely
• Weak battery
19. STARTING SYSTEM

START MOTOR

INSPECTION

Disconnect the start motor cable (2) from the start MAG (1).

Connect the start motor cable directly to the battery positive terminal (3). If the start motor does not turn, the starter motor is faulty.

REMOVAL

Turn the ignition switch turned to “OFF”

Release the rubber cap (1) and remove the terminal screw (2) to disconnect the start motor cable from the start motor.

Remove the two mounting bolts (3), then remove the start motor.
INSTALLATION

Coat a new O-ring (1) with engine oil and install it into the start motor groove.

Install the starter motor into the crankcase.

Install the two mounting bolts and engine ground cable, then tighten the bolts securely.

Connect the start motor cable to motor terminal with the terminal screw and tighten it securely.
START RELAY INSPECTION

Release the rubber cap (1) and remove the nut (2), then disconnect the start motor cable. Turn the ignition switch to “ON”.

Squeeze and hold the brake lever fully then push the starter switch. The coil is normal if the start MAG switch clicks.

Release the rubber caps (1) and remove the nuts (2), then disconnect the start motor cable, battery positive cable and harness wire. Disconnect the start MAG switch connector (3) and then remove start MAG.

Connect a fully charged 12 V battery positive wire to the relay switch Yellow/Red wire terminal and negative wire to the Green/Yellow wire terminal.

There should be continuity between the cable terminals while the battery is connected, and no continuity when the battery is disconnected.

SERVICE INFORMATION

GENERAL

A halogen head light bulb becomes very hot while the head light is on, and remains for a while after it is turned off. Be sure to let it cool down before servicing.

- Note the following when replacing the halogen headlight bulb
  - Wear clean gloves while replacing the bulb. Do not put finger prints on the headlight bulb, as they may create hot spots on the bulb and cause it to fail.
  - If you touch the bulb with your bare hands, clean it with a cloth moistened with alcohol to prevent its early failure.
  - Be sure to install the dust cover after replacing the bulb.

- Check the battery condition before performing any inspection that requires proper battery voltage.
- A continuity test can be made with the switches installed on the scooter.
- Route the wires and cables properly after servicing each component.
BULB REPLACEMENT

POSITION LIGHT

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Remove the bulb socket (1).

Remove the bulb (2) and replace with a new one.

Installation is in the reverse order of removal.
HEADLIGHT

A halogen headlight bulb becomes very hot while the headlight is ON, and remain for a while after it is turned OFF. Be sure to let it cool down before servicing.

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).
Disconnect the headlight cover
Disconnect the headlight connector (1) from the headlight bulb (2).

Install a new bulb in the headlight case,
Install the headlight and connect the headlight connector
20. LIGHTS/METERS/SWITCHES

FRONT TURN SIGNAL LIGHT
Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Turn the bulb socket (1), then remove the front turn signal light.

Push and turn the bulb counterclockwise to remove it, then replace with a new one.

Installation is in the reverse order of removal.

TAILLIGHT/BRAKE LIGHT/REAR TURN SIGNAL LIGHT
Remove the seat and met-in, then remove the light bulb socket.
Rear turn signal light

Push and turn the bulb counterclockwise to remove it, then replace with a new one.

Installation is in the reverse order of removal.

Taillight/Brake light

Push and turn the bulb counterclockwise to remove it, then replace with a new one.

Installation is in the reverse order of removal.
BRAKE LIGHT SWITCH

Remove the upper handlebar cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect front or rear light switch connectors and check for continuity between the switch terminals (1).

There should be continuity with the front or rear brake lever squeezed, and there should be no continuity with the front or rear brake lever is released.

IGNITION SWITCH

INSPECTION

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the ignition switch connector (2) and check the ignition switch (1) for continuity at the switch side connector terminals.

Continuity should exist between the color code wires as follows:

<table>
<thead>
<tr>
<th>COMB SW</th>
<th>BAT2</th>
<th>IG</th>
<th>E</th>
<th>BAT1</th>
<th>HA</th>

HANDLEBAR SWITCH

INSPECTION

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Right handlebar switch

Disconnect the right handlebar switch connector and check for continuity at switch side connector terminals. Continuity should exist between the color code wires as follows:

LUGGAGE BOX LIGHT SWITCH

INSPECTION

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Disconnect the luggage box light switch connector (2) and check the luggage box light switch (1) for continuity between the switch terminals.

There should be no continuity with the luggage box light switch pushed, and there should be continuity with the luggage box light switch is released.
FUEL PUMP

REMOVAL

Remove the seat and met-in
Remove the center cover
Remove the fuel pump connector
Be sure to relieve the fuel pressure
before removing fuel pump or fuel hose.

Remove the 6 nuts (1) and fuel unit
connectors(2) then remove the fuel hose.(3)

Remove the fuel pump(4)

Check the fuel pump O-ring.(5)
If was damage. Replace new one
20. LIGHTS/METERS/SWITCHES

INSPECTION

Connect the fuel unit wire connectors and turn the ignition switch “ON”.

* Before performing the following test, operate the turn signals to determine that the battery circuit is normal.

Check the fuel meter for correct indication by moving the fuel unit float up and down.

<table>
<thead>
<tr>
<th>Float Position</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper</td>
<td>Much (Full)</td>
</tr>

<td>From Much to Less</td>
</tr>
<tr>
<td>Apply</td>
<td>From Less to Much</td>
</tr>
</tbody>
</table>

The fuel meter is normal if it operates as above indicated. If not, check for poorly connected terminals or shorted wires.

Measure the resistance between the Yellow/White and Blue/White terminals of the fuel unit connector.

**Standard** (at 20°C/68°F):

<table>
<thead>
<tr>
<th>Float at full position</th>
<th>About 1100 Ω</th>
</tr>
</thead>
<tbody>
<tr>
<td>Float at empty position</td>
<td>About 100 Ω</td>
</tr>
</tbody>

INSTALLATION

Installation is in the reverse order of removal.
SIDE STAND SWITCH

INSPECTION

Remove the luggage box (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2).

Side stand switch is located on side stand

Disconnect the side stand switch connector (1).
There should be continuity between the Yellow/Green and Green with the side stand retracted.
There should be continuity between the Yellow/Black and Green with the side stand applied.

REMOVAL

Disconnect the side stand switch connector.
Remove the bolt (1) and side stand switch from the side stand.

INSTALLATION

Installs the side stand switch aligning the groove on the switch with the pin on the side stand stay.

Install and tighten the side stand switch bolt securely.
Connect the side stand switch connector.
HORN

INSPECTION

Remove the front cover (refer to the “FRAME COVERS REMOVAL/INSTALLATION” section in the chapter 2)

Disconnect the horn connectors (1) from the horn.

Connect a 12 V battery to the horn terminals. The horn is normal if it sounds when the 12 V battery is connected across the horn terminals.

REMOVAL/INSTALLATION

Disconnect the horn connectors from the horn.
Remove the bolt (2) and horn.

Installation is in the reverse order of removal.
